My Expo, 一個為展覽而生的內容探索工具
Hi-Fi Prototype README
程陽、龔柏年、鄭禕仁

We are excited to introduce MY Expo - an app which aims to link exhibition to people and provide better experience of entire exhibition-visiting experience.To demonstrate our prototype, we've provided a guide to help you understand what our Hi-Fi Prototype can and cannot do.

We built the prototype in Java using Android Studio, in order to provide native environment for android phones. The .apk file can be downloaded from this link. The user don't need to login to use our app, as it's just a prototype. However, the final version will require user to login in order to provide more personal information.

Limitations
● This prototype does not allow user to register. There only exists one user, and the "interested" exhibition type are also hard-coded.

● The "Buy ticket" feature does not allow user to navigate to another ticket app (ex.KKTIX), the Toast message are hardcoded.

● The "Follow " feature is hardcoded, also, user are not allowed to upload article.

● For the questionnaire feature, the data user fill out will not be stored, since the database is now hard-coded.

● The gift type are now fixed , so everyone would get the same type of gift.

● The after-exhibition questionnaire feature will not be stored, since the database is now hard-coded.

The fully functioning version of this app will address each of these limitations. In addition, the biggest value-added of the app relies on the social interaction between people, including follow, comment and upload article. This is perhaps the most important feature to be fully implemented in the final version of the app and which faces limitations in this Hi-Fi prototype
